Table 5: The 3-fold cross validation relative mean squared error and Friedman ranks for all datasets when the best hyperparameter configuration trial (Best), linear regression via least squared with the option of adding instance description (LSf) or not (LS) to the ensemble, non-hyperparametric stacking stepwise regression over residuals adding instance description (RSWf) or not (RSW) to the ensemble and non-hyperparametric stacking stepwise regression over residual with the heuristic to provide zero weights to some models adding instance description to the ensemble (RSWHf) or not (RSWH), all taking into account several baseline systems (kNNR, Ridge, Lasso and SVR) and the HB sampling strategy.
